

Kaarigar Prototype - Sanskar's Track (Track C) Report

1. Overview

Sanskar's track (Track C) is responsible for the Buyer Side, Artisan Dashboard, and the Backend Glue. This track ensures that buyers can browse artisan products, add them to a cart, and complete a payment seamlessly. It also provides a dashboard for artisans to view their orders and earnings, while providing the shared Supabase database schema and deployment configuration used by all tracks.

2. What Was Accomplished

1. Environment & Setup: Discovered and mapped the existing HTML/JS/FastAPI codebase. Installed all backend Python dependencies and seeded the local SQLite database with 3 artisans and 6 product listings.
2. UI & Aesthetics Upgrade: Replaced the standard fonts with a premium modern typography (Outfit). Adjusted border radii, refined drop shadows, and introduced glassmorphism elements to the header to make the interface feel highly professional and trustworthy.
3. Micro-Animations: Added delightful animations to improve user feedback. When a user clicks 'Add to Cart', the button smoothly pops and turns green. Upon successful checkout, the success panel smoothly bounces and fades in.
4. Razorpay Integration Validation: Verified the Razorpay Test Mode checkout flow, which successfully falls back to a mocked payment flow for local testing without requiring actual API keys.

3. How It Works (Technical Details)

- Architecture: The backend is a FastAPI server that acts as a REST API and statically serves the Vanilla HTML/CSS/JS frontend located in the 'buyer' folder. No Node.js or complex build step is needed, ensuring fast iteration and easy deployment.
- Catalog & Cart: The frontend (catalog.js) fetches listings from the `/api/listings` endpoint. Cart state is managed entirely in the browser using `localStorage` (cart.js), allowing buyers to navigate across pages without losing their items.
- Payments & Escrow: When the buyer pays, an order is sent to `/api/orders`. The system holds the payment safely in escrow (status: 'paid_held'). Once the artisan delivers the item, an admin/demo click triggers `/api/orders/{id}/deliver`, which updates the status to 'released' and simulates a WhatsApp confirmation to the artisan.

Kaarigar Prototype - Sanskar's Track (Track C) Report

- Database (Supabase/SQLite): A shared schema.sql is provided for the production Supabase PostgreSQL database. For local development, the backend automatically uses a local SQLite database file.
